

# Top 8 Java EE deployment pitfalls

An easier life for Developers and IT operations!

Andrew Phillips

**Xebia**Labs

# Who we are

- **Xebia**Labs
- Spin-off of Dutch IT architects Xebia
- Specialists in enterprise consultancy
- Lots of experience of both the development and operations sides of deployment

# What's in a name?

- We're talking about **Java EE application deployment**
- *“What can be so hard about deploying an EAR file?”*

# What's in a name?

- The scope and impact of a deployment is easy to underestimate
- Cuts across multiple departments and skill sets
- Lengthy, interdependent, time-constrained process

# Pitfall #8

Failure to take deployment into account when designing infrastructure and middleware.

Solution:

- Involve middleware deployment people and developers in middleware and infrastructure projects.
- Design deployment into the architecture!

# Pitfall #7

Failure to take deployment into account when designing and developing applications.

## Solutions:

- Involve all operations departments in application projects: Java EE, DBAs, Unix, infra, etc.
- Start deploying after the first iteration.

# Pitfall #6

Failure to develop against representative middleware.

Solutions:

- Let developers know which versions of JDKs, middleware, etc. is used.
- Allow developers to deploy against a representative middleware environment.

# Pitfall #5

Reliance on deployment manuals.

Solution:

- Make deployment obvious: use best practices, standard features, etc.
- Prefer automation over documentation.

# Pitfall #4

Failure to keep middleware environments in sync.

Solution:

- Don't allow manual changes to middleware environments.

# Pitfall #3

Failure to keep an overview of the configurations of the middleware.

Solution:

- Keep a CMDB of your middleware configuration.

# Pitfall #2

Failure to test deployments.

Solution:

- Do an end-to-end test after a deployment has been done.

# Pitfall #1

Failure to (completely) automate deployments.

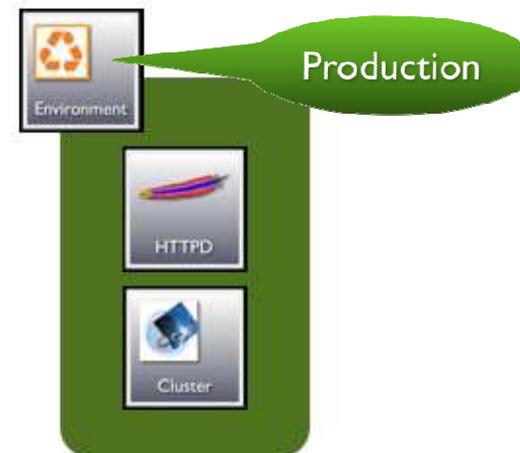

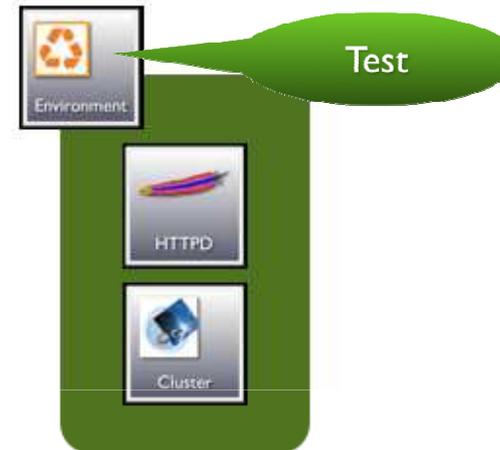

Solution:

- Automate your deployments!

# Enter Deployit

-  Deployit : our solution
- Based on our in-depth middleware knowledge and deployment experience
- “The seemingly impossible is possible!”

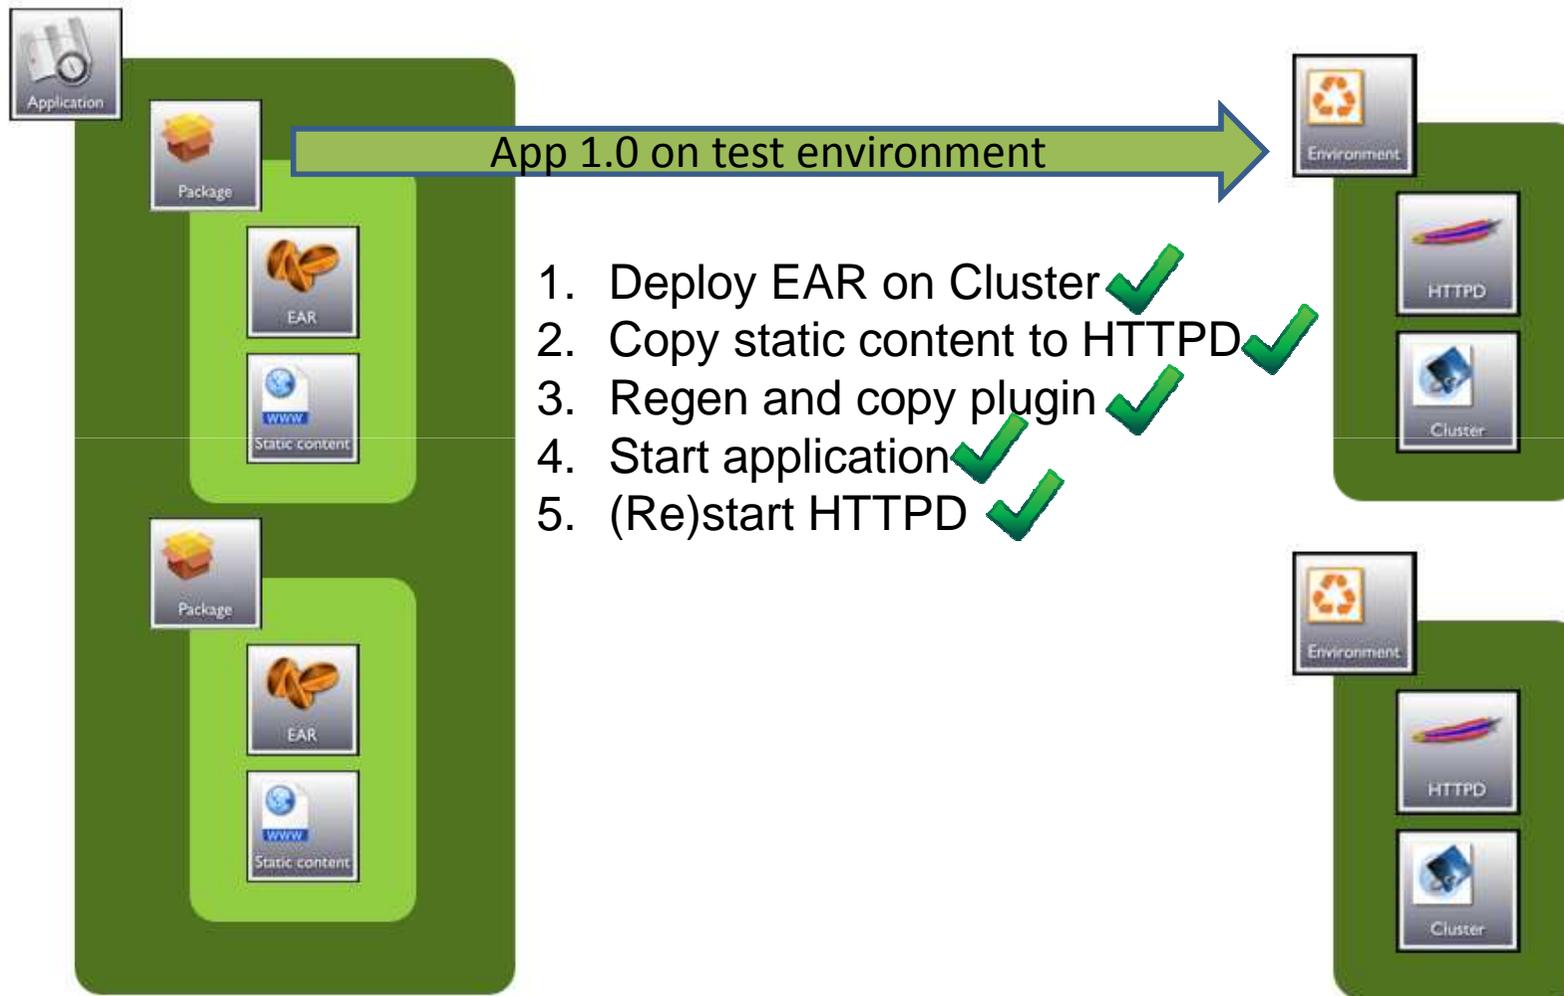

# Things...

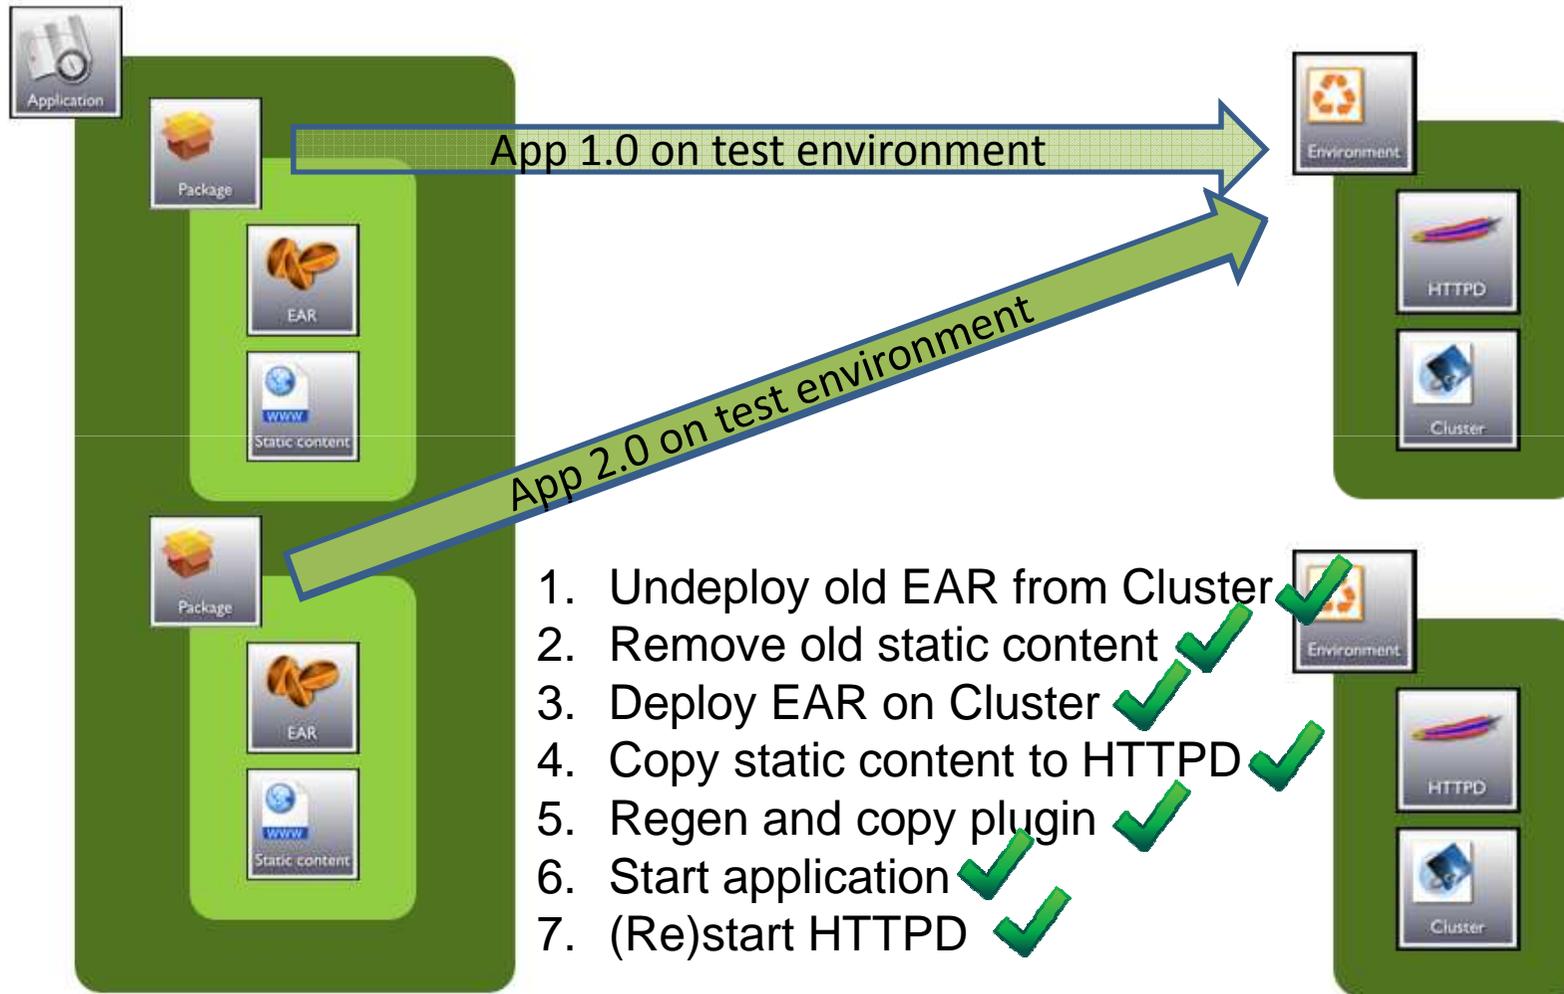

# Configuration Management

- CMDB stores *Configuration Items*
- Stores relations between those items
- Keeps a history of changes

# ...and actions

# ...and actions

# Actual view

The screenshot shows the Deployit web interface. At the top, there is a green header with the text "Deployit" on the left and "Anonymous Deploy Inspect Help" on the right. Below the header, there are three tabs: "Actual", "Design", and "Change plan", with "Actual" being the active tab. The main content area is divided into a left sidebar and a central table. The sidebar contains a search bar and a list of categories: "All", "Hosts", "Middleware", "Environments", "Applications", "Deployments", "Security Domains", "Permission Schemes", and "Groups". The central table has two columns: "Label" and "Type". The table lists various deployment components, including hosts, environments, WebSphere cells and nodes, clusters, and Xebia applications of different versions (1.0 and 2.0) with their respective configurations and static content. At the bottom of the interface, there are three buttons: "Start", "Stop", and "Forcibly Stop", followed by a dropdown menu.

Label	Type
Apache 2.2	ApacheHttpd
Apache 2.2 host (VMWare)	Host
Test environment	Environment
WAS 5.1 cell	WebSphereCell
WAS 5.1 host (VMWare)	Host
WAS 5.1 node	WebSphereNode
WAS 5.1 test cluster	WebSphereCluster
Xebia	Application
Xebia - 1.0	ApplicationPackage
Xebia - 1.0 - Xebia-1.0.ear	EnterpriseApplication
Xebia - 1.0 - configuration	ApplicationConfiguration
Xebia - 1.0 - staticcontent - Xebia-1.0.zip	StaticContent
Xebia - 2.0	ApplicationPackage
Xebia - 2.0 - Xebia-2.0.ear	EnterpriseApplication
Xebia - 2.0 - configuration	ApplicationConfiguration
Xebia - 2.0 - staticcontent - Xebia-2.0.zip	StaticContent

# Change Management

- *Change plan* is a set of changes that go together
- *Steps* make those changes happen in the middleware environment and are automatically determined
- Steps show what middleware actions will be taken
  - On a level that a middleware administrator can understand

# Steps

## Deployit

# Conclusion

- Deployments are hard, but not impossible to get under control
- Technical and process-related pitfalls are common
- Suitable deployment automation products can address and overcome these problems
